Overview

This lab covers Zeek’s scripting language. It introduces the major keywords and components required in a Zeek script. The lab then uses these scripts to analyze processed log files.

Objectives

By the end of this lab, students should be able to:

1. Develop scripts using Zeek’s scripting language.
2. Analyze processed log files using Zeek scripts.
3. Modify log streams for creating additional events and notices.

Lab topology

Figure 1 shows the lab workspace topology. This lab primarily uses the Zeek2 machine for offline Zeek script development and offline packet capture processing and analysis.

![Lab topology diagram]

Figure 1. Lab topology.

Lab settings

The information (case-sensitive) in the table below provides the credentials to access the machines used in this lab.
Table 1. Device credentials for lab workspace.

<table>

Lab roadmap

This lab is organized as follows:

1. Section 1: Introduction to scripting with Zeek.
2. Section 2: Log file analysis using Zeek scripts.
3. Section 3: Modifying Zeek log streams.
1 Introduction to scripting with Zeek

Zeek includes its own event-driven scripting language which provides the primary means for an organization to extend and customize Zeek’s functionality. By modifying Zeek’s log streams, a more in-depth analysis can be performed on network events.

Since Zeek’s scripting language is event-driven, we define which events we need Zeek to respond to when encountered during network traffic analysis.

1.1 Zeek script events

The script below shows events that will be explored during this lab. When developing a Zeek script, the script’s functionalities are wrapped within respective events.

```zeek
1* event zeek_init(){
2  /* code */
3 }  
4* event zeek_done(){
5  /* code */
6 }  
7* event tcp_packet(){
8  /* code */
9 }  
10* event udp_request(){
11  /* code */
12 }  
13* event udp_reply(){
14  /* code */
15 }
```

- **zeek_init** event: activated when Zeek is first initialized.
- **zeek_done** event: activated before Zeek is terminated.
- **tcp_packet** event: activated when a packet containing a TCP header is processed.
- **udp_request** event: activated when a packet containing a UDP request header is processed.
- **udp_reply** event: activated when a packet containing a UDP reply header is processed.

Additional events and their required parameters are outlined and explained in Zeek’s official documentation.

1.2 Zeek module workspace

The script below uses the `module` keyword which assigns the script to a namespace. Codes from other scripts can be accessed by including a matching module. The `export` keyword is used to export the code entered in its block with the module workspace.
Lab 6: Introduction to Zeek Scripting

- **module ZeekScript**: changes the module workspace to ZeekScript.
- **export** block: code entered here will be exported with the module workspace.

Exporting code with a module workspace allows more advanced scripts to be built on top of other scripts.

### 1.3 Zeek log streams

The script below shows the log stream functionality. When developing a Zeek script, all processed outputs will be sent to a specific log stream. These log streams will contain the format of the corresponding log file output. We can create new streams, modify original streams or append additional parameters to existing streams.

```zeek
event connection_established(){
  Log::create_stream(LOG, format, path);
  Log::write(Logstream, data);
}
```

- **connection_established** event: activated when a host makes a connection to a receiver.
- **Log::create_stream**: creates a new log stream, will a name, format structure and path.
- **Log::write**: writes included data to the specified log stream.

Additional log stream commands are explained in detail in Zeek’s official documentation.

### 2 Log file analysis using Zeek scripts

With Zeek’s event-driven scripting language, we can create specific event-based filters to be applied during packet capture analysis. This section shows example scripts for network analysis.

#### 2.1 Starting a new instance of Zeek

**Step 1.** On the top of the lab workspace, click on the Bro2 button as shown below to enter the Bro2 machine.
**Step 2.** On the left side of the Bro2 desktop, click on the Terminal icon as shown below.

![Terminal Icon](image)

**Step 3.** Start Zeek by entering the following command on the terminal. This command enters Zeek’s default installation directory and invokes `zeekctl` tool to start a new instance. To type capital letters, it is recommended to hold the `Shift` key while typing rather than using the `Caps` key. When prompted for a password, type `password` and hit `Enter`.

```
cd $ZEEK_INSTALL/bin && sudo ./zeekctl start
```

A new instance of Zeek will now be active, and we can proceed to the next section of the lab.

### 2.2 Executing a UDP Zeek script

**Step 1.** Navigate to the workspace directory. To type capital letters, it is recommended to hold the `Shift` key while typing rather than using the `Caps` key.

```
cd $ZEEK_LABS
```
**Step 2.** Display the content of the lab6_sec2-2.zeek Zeek script using `nl` command. `nl` shows the line numbers in the file.

```
nl lab6_sec2-2.zeek
```

The script is explained as follows. Each number represents the respective line number:

1. Event **udp_request** activated when a packet containing a UDP Request header is processed. The related packet header information is stored in the connection data structure passed to the function through the `u` variable.
2. Prints the specified string. `%s` is a format specifier for strings with `fmt`. It indicates the position of the corresponding variable’s information in the string. `u$id$resp_h` retrieves the destination IP address from the UDP packet.
3. End of the **udp_request** event.
4. Event **udp_reply** activated when a packet containing a UDP Reply header is processed. The related packet header information is stored in the connection data structure passed to the function through the `u` variable.
5. Prints the specified string. `u$id$resp_h` retrieves the destination IP address from the UDP packet.
6. End of the **udp_reply** event.

**Step 3.** Process a packet capture file using the Zeek script.

```
zeek -r Sample-Captures/smallFlows.pcap lab6_sec2-2.zeek
```
The packet capture file is processed into output log files. Since we did not create a new log stream, the script’s output is displayed on the standard output (the screen). When `udp_request` or `udp_reply` events are triggered, the resulting packet information is displayed.

### 2.3 Executing a TCP Zeek script

**Step 1.** Display the content of the `lab6_sec2-3.zeek` Zeek script using `nl` command. `nl` shows the line numbers in the file.

```
nl lab6_sec2-3.zeek
```

The script is explained as follows. Each number represents the respective line number:

1. Event `tcp_packet` activated when a packet containing a TCP header is processed. The related packet header information is stored in the connection data structure passed to the function through the `u` variable. Additional TCP-related information is passed in a similar manner.

2. Prints the specified string. `%s` is a format specifier for strings with `fmt`. It indicates the position of the corresponding variable’s information in the string. `u$id$resp_h` retrieves the destination IP address from the TCP packet.
3. End of the `tcp_packet` event.

**Step 2.** Process a packet capture file using the Zeek script.

```
$ zeek -r Sample-Captures/smallFlows.pcap lab6_sec2-3.zeek
```

The following output is produced:

```
Destination Port #: 80/tcp
Destination Port #: 80/tcp
Destination Port #: 80/tcp
Destination Port #: 80/tcp
Destination Port #: 80/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
Destination Port #: 443/tcp
```

When the `tcp_packet` event is triggered, the resulting packet information is displayed. Highlighted is an example of Port 80 and Port 443 traffic.

These examples highlight Zeek’s capabilities of tracking specific traffic. For instance, a script can be designed to collect all Port 80 traffic daily and to export it to a log file. In the following section we introduce log streams.

### 3 Modifying Zeek log streams

Zeek log streams determine where an event’s output will be returned, as well as how it is formatted. It is possible to append new streams, modify default streams, or remove streams.
Before continuing, we must clear the lab workspace directory.

**Step 1.** Display the contents of the `lab_clean.sh` shell script using `nl` command.

```
nl lab_clean.sh
```

The shell script removes a list of files expected to be generated by Zeek’s processing using default log streams. Executing this shell script will clear the directory of log files generated previously. Output messages from running this script are not displayed in the Terminal, instead the code `> /dev/null 2>&1` will set errors and notices to be sent to a null folder, effectively eliminating them.

**Step 2.** Execute the `lab_clean.sh` shell script. If required, type `password` as the password.

```
./lab_clean.sh
```

With the workspace directory cleared, we can move to the next section.

### 3.1 Renaming the conn.log stream

In this example, we will rename the `conn.log` file to be `UpdatedConn.log`. Renaming log streams can help with files organization, especially if a log file has been modified from its original functionality.

**Step 1:** Display the contents of the `lab6_sec3-1.zeek` Zeek script using `nl` command.

```
nl lab6_sec3-1.zeek
```
The script is explained as follows. Each number represents the respective line number:

1. Event `zeek_init` activated when Zeek is first initialized.
2. Creates a local variable `update` initialized to the default `Conn::LOG` filter.
3. Sets the `update` variable’s path to `UpdatedConn.log`.
4. Appends the new filter to the active log streams.
5. End of the `zeek_init` event.

Step 2. Process a packet capture file using the Zeek script.

```
zeek -r Sample-Captures/smallFlows.pcap lab6_sec3-1.zeek
```

Step 3. List the generated log files in the current directory.

```
ls
```

```
lab6_sec2-2.zeek  packet_filter.log  weird.log
lab6_sec2-3.zeek  Sample-Captures  weka
lab6_sec3-1.zeek  ScanFilter.zeek  x509.log
lab6_sec3-2.zeek  sniff.log         ZeekBruteForceDetection.zeek
files.log         TCP-Traffic     ZeekScanDetection.zeek
http.log          lab8_create_sets.sh
ICMP-Traffic      lab8_mallcious.sh
lab3_sec3-2.awk   lab_clean.sh     UpdatedConn.log
```

Note the `UpdatedConn.log` file in the fourth column. Since we did not change any formatting, it is an exact replica of the original `conn.log` file.

### 3.2 Updating the conn.log stream
In this example, we modify the `conn.log` file to generate an additional `conn-http.log` file. This modification will split the `conn.log` contents between two log files, which is useful in organizing specific events.

**Step 1.** Execute the included `lab_clean.sh` shell script. If required, type `password` as the password.

```bash
./lab_clean.sh
```

**Step 2.** Display the contents of `lab6_sec3-1.zeek` Zeek script using the `nl` command.

```bash
nl lab6_sec3-2.zeek
```

The script is explained as follows. Each number represents the respective line number:

1. Boolean function that has the parameter `rec`, an instance of Conn::Info.
2. Returns True if the service stored in `rec` is the HTTP protocol.
3. End of the function.
4. Event `zeek_init` activated when Zeek is first initialized.
5. Creates a local filter with `http` related naming and pathing.
6. Appends the new filter to the active log streams.
7. End of the `zeek_init` event.

**Step 2:** Process a packet capture file using the Zeek script.

```bash
zeek -r Sample-Captures/smallFlows.pcap lab6_sec3-2.zeek
```
Step 3: List the generated log files in the current directory.

```
ls
```

Note the `conn-http.log` file in the first column. This file will have the same formatting as the `conn.log` file; however, it will only contain HTTP traffic.

### 3.3 Closing the current instance of Zeek

After you have finished the lab, it is necessary to terminate the currently active instance of Zeek. Shutting down a computer while an active instance persists will cause Zeek to shut down improperly and may cause errors in future instances.

**Step 1.** Stop Zeek by entering the following command on the terminal. If required, type `password` as the password. If the Terminal session has not been terminated or closed, you may not be prompted to enter a password. To type capital letters, it is recommended to hold the `Shift` key while typing rather than using the `Caps` key.

```
cd $ZEEK_INSTALL/bin & & sudo ./zeekctl stop
```

Concluding this lab, we have introduced the Zeek scripting language. Using event-driven functionality, Zeek scripts can be used to customize the output log streams. Besides
renaming existing files, you can also split the files to generate a more protocol or event-specific log file.
